Retail Security

Retailers are facing an increasing demand for superior store guarding as offences are becoming more complex and organised.

Our retail officers are essentially trained to protect the safety and well-being of our client's customers and staff while preventing any financial damage or loss including the potential to remove harmful persons from the property.

We also encourage our officers to liaise with the local constabulary officers in order to build a relationship as they are essentially an emissary for both ourselves and our customer.

Fire Systems

The Fire system you choose will depend on your building structure, purpose and building use, our engineers will ascertain this requirement as per the Fire safety order 2005 and identifying where appropriate which parts of the premises that need coverage.

We can provide L1, L2, or L3 systems as required to meet all British Standard legislation and the annual maintenance of these systems can also be agreed prior to instalment taking place.

Alarm installation- Monitoring & Maintenance

The type of alarm you choose is paramount to your buildings safety, Bells-only alarms deter intruders and may alert a pedestrian but will not get an automatic Police response however one of our remotely monitored alarms ensures that ourselves or in the case of a confirmed intruder the Police are also contacted on your behalf, this also enables us to check signals for false activations so avoiding the risk of losing the police response to your alarm.

All our alarm engineers are registered with the National Security Inspectorate (NSI) which champions high standards and ensures we comply with all British and European standards EN50131, both hard wired and wireless alarms are available.

CCTV Installations – Monitoring & Maintenance

CCTV is now considered crucial in both crime prevention and detection being both visible and effective and can be as simple or as complex as the situation demands.

We can offer an extensive range of systems incorporating intelligent video analysis software which can be used for facial recognition, automatic number plate recognition, intruder detection or simply slip and fall detection supplied and fitted by trained engineers.
